What is the Difference Between a Two Stroke and Four Stroke Engine?

Ads by Google [Honda 4 Stroke](#) [Four Stroke Engine](#) [Two Stroke Oil](#) [Engine](#)

- [Two Stroke Compression](#)
- [Two Stroke Fuel Injection](#)
- [Two Stroke Crankshaft](#)
- [Two Stroke Outboard](#)
- [Two Stroke Lubrication](#)
- [Two Stroke Software](#)
- [Two Stroke Video](#)

To understand the mechanical differences between a two stroke and four stroke engine, lets first consider how the four stroke engine works. The four strokes are:

Intake: The piston travels down the cylinder while the intake [valve](#) is opened to allow a mixture of fuel and air to enter the combustion chamber.

Compression: The intake valve is closed and the piston travels back up the cylinder thereby compressing the gasses.

Combustion: The [spark plug](#) ignites the compressed gas causing it to explode, which forces the piston down.

Exhaust: The piston rises up the cylinder as the exhaust valve is opened, allowing the piston to clear the chamber to start the process over.

Each time the piston rises and falls it turns the crankshaft that is responsible for turning the wheels. This is how fuel is converted into forward motion.

[Ask a Diesel Mechanic Now](#) 38 Diesel Mechanics Are Online! Current Wait Time: 10 Minutes. [Diesel.Justanswer.com](#)

Of note here is that the spark plug only fires once every other revolution. Also, there is a sophisticated set of mechanisms working in synchronization to create the four strokes. A [crankshaft](#) must alternately tip a [rocker arm](#) attached either to the intake or exhaust valve. The rocker arm returns to its closed position via a spring. The valves must be seated properly in the cylinder head to avoid compression leaks. In other words, a [symphony](#) of mechanical events occurs.

In the two stroke engine, all four events are integrated into one simple downward stroke, and one upward stroke. Two strokes. *Intake and exhaust are both integrated into the compression and combustion movement of the piston, eliminating the need for valves. This is accomplished*

A Special Note on Wikipedia

Wikipedia is a good source of general reference information that usually has data that is on par with other encyclopedias. However, when one is writing a research paper it is never favorable to cite general reference sources. Primary and specific sources are always the best sources of information. Wikipedia, and other encyclopedias, are good for users who wish to obtain general information. Wikipedia can also be useful for starting research if you investigate the sources they are citing to obtain more specific knowledge.

Top of the article

The screenshot shows the top of the Wikipedia article for 'Moon'. It includes the Wikipedia logo, navigation links (Main page, Contents, Featured content, etc.), and the start of the article text. The article text begins with: 'This article is about Earth's Moon. For moons in general, see *Natural satellite*. For other uses, see *Moon (disambiguation)*. The Moon is Earth's only natural satellite^[a] and the fifth largest satellite in the Solar System. It is the second largest natural satellite in the Solar System relative to the size of its primary (after Charon, which orbits dwarf planet Pluto), a quarter the diameter of Earth and 1/81 its mass. The Moon is the second densest satellite after Io. It is in synchronous rotation with Earth, always showing the same face; the near side is marked with dark volcanic maria among the bright ancient crustal highlands and prominent impact craters. It is the brightest object in the sky after the Sun, although its surface is actually very dark, with a similar reflectance to coal. Its prominence in the sky and its regular cycle of phases have since ancient times made the Moon an important cultural influence on language, the calendar, art and mythology. The Moon's gravitational influence produces the ocean tides and the minute lengthening of the day. The Moon's current orbital distance, about thirty times the diameter of the Earth, causes it to appear almost the same size in the sky as the Sun, allowing it to cover the Sun nearly precisely in total solar eclipses. The Moon is the only celestial body on which humans have landed. While the Soviet Union's Luna programme was the first to reach the Moon with unmanned spacecraft in 1959, the United States' NASA Apollo program achieved the only manned missions to date, beginning with the first manned lunar orbiting mission by Apollo 8 in 1968, and six manned lunar landings between 1969 and 1972—the first being Apollo 11 in 1969. These missions returned over 380 kg of lunar rocks, which have been used to develop a detailed geological understanding of the Moon's origins (it is thought to have formed some 4.5 billion years ago in a giant impact event involving Earth), the formation of its internal structure, and its subsequent history.'

Author: The authors on this site are all users, and therefore it is impossible to discern their credentials and authority to speak on any given subject. This is the main reason why Wikipedia.org should not be cited. While many of the articles on the site have citations and current dates, the fact that the information is scholarly in nature and yet lacks credible authors is unacceptable.

References

Notes

- ^a The maximum value is given based on scaling of the brightness from the value of -12.74 given minimum Earth-Moon distance given there, after the latter is corrected for the Earth's equatorial radius a similar scaling using the maximum Earth-Moon distance of $407\,000$ km (given in the factsheet) the earthshine is $[\text{Earth albedo} \times (\text{Earth radius} / \text{Radius of Moon's orbit})^2]$ relative to the direct sol equatorial radius² = $6\,367$ km.)
- ^a The range of angular size values given are based on simple scaling of the following values give angular size is 1896 arcseconds. The same fact sheet gives extreme Earth-Moon distances of $407\,000$ km, corrected for the Earth's equatorial radius of $6\,378$ km, giving $350\,600$ km.
- ^a Lucey *et al.* (2006) give 10^7 particles cm^{-2} by day and 10^5 particles cm^{-2} by night. Along with pressures given in the infobox (rounded to the nearest order of magnitude; 10^{-7} Pa by day and 10^{-8} Pa by night).
- ^a Earth does have a number of co-orbital near-Earth asteroids (Morais *et al.*, 2002), but these are rare.
- ^a This age is calculated from isotope dating of lunar rocks.
- ^a More accurately, the Moon's mean sidereal period (fixed star to fixed star) is 27.321661 days (27.321582 days ($27\text{d } 07\text{h } 43\text{m } 04.7\text{s}$) (*Explanatory Supplement to the Astronomical Ephemeris*, 1991, at p.107).
- ^a More accurately, the Moon's mean synodic period (between mean solar conjunctions) is 29.5306 days (1961, at p.107).
- ^a The Sun's apparent magnitude is -26.7 , and the full Moon's apparent magnitude is -12.7 .
- ^a On average, the Moon covers an area of 0.21078 square degrees on the night sky.

Criteria for Evaluating Websites

Main Criteria	Descriptions/Details	Possible Answers
Author	Who is providing the information? What do you know about them and their credentials, are they an expert? Can you find out more and contact them? Search for author or publisher in search engine. Has the author written several publication on the topic?	User generated, journalist, varies greatly, none given/no, NA, Scholars in research
Publisher/ Affiliation	Is there a sponsor or affiliation? Who is linking to the page? Do they take responsibility for the content?	Credible publisher, yes but doesn't take responsibility, NA, questionable publisher questionable responsibility, Yes but not credible, yes but not necessarily credible
Bias/ Balance/ Purpose	Is the language free of emotion? Does the organization or author indicate there will be bias? Is the website to inform or spread an agenda? Are there ads? Are they trying to make money? Why did they write the article?	Sometimes, Sometimes - rightist, Sometimes - leftist, corporate sponsorship, seems balanced, NA, generates content to sell ad space
Citations & Links	Copy and paste a sentence into Google to see if the text can be found elsewhere Are there links to related sites and organized? Citations/Bibliography provided?	Citations, citations and links, links, no, NA, maybe
Accuracy	Is the Data verifiable and accurate?	Good, unknown, varies, NA
Complete	Is the source comprehensive?	Good, unknown, varies, NA
Currency	When was the source last updated? Does the source even have a date?	Yes - Up to date, Yes - Varies, no, NA, unknown
Design & Quality	Is the overall web design easy to use? Is it presented in a professional manner? Does it seem like current design?	Good, NA, Bad, old site, average
Reproduced	Was it reproduced? If so, from where? Type a sentence in Google to verify If it was reproduced, was it done so with permission? Copyright/disclaimer included?	No, NA, Yes with permission, yes without permission, sometimes with permission, sometimes without permission
Credible	Based on previous criteria, decide whether the source is credible overall	Yes, No, NA, Maybe
